Description

The C-CBL-driven Tyro3 Ubiquitination Intrachain TR-FRET Assay Kit is a sensitive high-throughput screening (HTS) TR-FRET Assay Kit, designed to measure C-CBL E3 ligase activity in a homogeneous 384 reaction format. It utilizes a Europium cryptate-labeled Ub (donor) and a Cy5-labeled Ub (acceptor) to complete the TR-FRET pairing. Since both the TR-FRET donor and acceptor are incorporated into poly-ubiquitin chains, this FRET-based assay requires no time-consuming washing steps, making it especially suitable for high throughput applications as well as real-time analyses of polyubiquitination. Of note, the assay kit does not detect mono-ubiquitination.

Alternatively, under the same experimental conditions the AXL kinase (BPS Bioscience #40180) can be used instead of Tyro3 as C-CBL ubiquitination substrate.

Figure 1. C-CBL-driven Tyro3 ubiquitination intrachain TR-FRET Assay Kit schematic

Background

Covalent conjugation to ubiquitin (Ub) is one of the major post-translational modifications regulating protein stability, function, and localization. Ubiquitination is the concerted action of three enzymes: a Ub-activating enzyme (E1), a Ub-conjugating enzyme (E2), and a Ub ligase (E3). The specificity and efficiency of ubiquitination are largely determined by the E3 enzyme, which directs the last step of the Ub-conjugating cascade by binding to both an E2~Ub conjugate and a substrate protein. This step ensures the transfer of Ub from E2~Ub to the substrate, leading to its mono- or poly-ubiquitination.

Casitas B-lineage lymphoma (C-CBL) is a RING-type E3 ligase and a member of the CBL family of proteins that comprises three homologues. It contains an N-terminal tyrosine kinase binding (TKB) domain comprised of a four-helix bundle, a calcium binding EF-hand and a Src homology (SH2) domain, followed by a linker helical region and the RING domain responsible for its catalytic function. Additionally, C-CBL contains proline-rich regions and several tyrosine-phosphorylation sites mediating the association with various targets, as well as a ubiquitin-associated (UBA) domain for ubiquitin binding and dimerization. C-CBL interacts with a large number of target proteins implicated in cell survival, migration and proliferation. The ubiquitin ligase activity of C-CBL is up-regulated by the phosphorylation of Tyrosine (Tyr) 371, which is located in the helix linker between the TKB and RING domains. Phosphorylation of Tyr371 opens C-CBL from its auto-inhibitory conformation, allowing binding to E2 and substrates. C-CBL is phosphorylated by receptor-type tyrosine kinases such as Tyro3, which can also serve as a substrate for C-CBL-mediated ubiquitination.

Applications

- 1. Screen inhibitors of C-CBL Ubiquitin ligase activity in drug discovery and high throughput applications.
- 2. Determine compound IC₅₀ and perform C-CBL real-time kinetic analyses.

Supplied Materials

Catalog #	Name	Amount	Storage	
80301	UBE1 (E1)*	40 μg	-80°C	
80314	UBCH5b (E2)*	60 μg	-80°C	
100370	C-CBL, GST-Tag*	8 μg	-80°C	Avoid multiple
40293	TYRO-3, GST-Tag*	16 μg	-80°C	freeze/
78307	TRF Ubiquitin Mix (200x)	50 μΙ	-80°C	thaw
	ATP (4 mM)	2 x 1 ml	-80°C	cycles
78269	CBL assay buffer 2	2 x 10 ml	-80°C	
	White, nonbinding, low volume microtiter plate		Room Temp	

^{*}The initial concentration of protein is lot-specific and will be indicated on the tube containing the protein.

Materials Required but Not Supplied

- Fluorescent microplate reader capable of measuring Time Resolved Fluorescence Resonance Energy Transfer (TR-FRET)
- Adjustable micropipettor and sterile tips
- Rotating or rocker platform

Storage Conditions

This assay kit will perform optimally for up to 6 months from date of receipt when the materials are stored as directed. **Avoid multiple freeze/ thaw cycles!**

Safety

This product is for research purposes only and not for human or therapeutic use. This product should be considered hazardous and is harmful by inhalation, in contact with skin, eyes, clothing, and if swallowed. If contact occurs, wash thoroughly.

Contraindications

The C-CBL-driven Tyro3 Ubiquitination Intrachain TR-FRET Assay Kit is compatible with up to 1% final DMSO concentration. We recommend preparing the inhibitor in no higher than 5% DMSO solution in buffer and using 4 µl per well.

Tyro3 kinase inhibitors may inhibit the ubiquitination reaction. It is recommended to confirm if the Test Compounds explicitly affect C-CBL ligase activity and not Tyro3 kinase activity by determining the effect of compounds on Tyro3 activity in the TYRO3 Kinase Assay Kit (BPS Bioscience #79593).

Assay Protocol

- All samples and controls should be performed in triplicates
- The assay should include a "Blank", a "Positive control", and a "Negative control"

1) Thaw **UBE1**, **UBCH5b**, **C-CBL**, **TYRO3**, **TRF Ubiquitin Mix**, **CBL assay buffer 2**, and **ATP** on ice. Briefly spin the tubes to recover their full contents. Calculate the amount of protein required for the assay and dilute enough for the assay. Refer to step 6 (preparing the master mix) to calculate how much of each protein is needed.

Aliquot unused proteins into 2-4 aliquots as may be necessary (single use aliquots) and store them at -80°C. Aliquot the assay buffer and ATP and store at -80°C.

Note: UBE1, UBCH5b, C-CBL, TYRO3, TRF Ubiquitin Mix, and assay buffer are sensitive to freeze/thaw cycles. Avoid multiple freeze-thaw cycles. Do not re-use the diluted proteins.

- 2) Prepare 5x TRF Ubiquitin Mix in CBL assay buffer 2 by making a 40-fold dilution of the stock 200x TRF Ubiquitin Mix (e.g. add 1 volume of stock TRF Ub Mix to 39 volumes of assay buffer).
- 3) Prepare appropriate amounts of diluted proteins. The concentration of each protein is lot-specific and is indicated on the tube. Verify the initial concentration and dilute accordingly.

Dilute UBE1 in assay buffer at 96 ng/ μ l (800 nM - the final concentration in the reaction will be 40 nM); Dilute UBCH5b in assay buffer at 144 ng/ μ l (2 μ M – the final concentration in the reaction will be 100 nM); Dilute C-CBL in assay buffer at 7.1 ng/ μ l (100 nM – the final concentration in the reaction will be 12.5 nM); Dilute TYRO3 in assay buffer at 15.4 ng/ μ l (200 nM – the final concentration in the reaction will be 25 nM);

Note: Keep all diluted proteins on ice until use. Do not freeze and re-use diluted proteins.

- 4) Prepare the Test Inhibitor (4 μ l/well): for a titration, prepare serial dilutions at concentrations 5-fold higher than the desired final concentrations. The final volume of the reaction is 20 μ l.
 - a) If the Test Inhibitor is water-soluble, prepare serial dilutions in the Assay Buffer, 5-fold more concentrated than the desired final concentrations. For the positive and negative controls, use 1x Assay Buffer (Diluent Solution).
 - b) If the Test inhibitor is soluble in DMSO, prepare the test inhibitor at a concentration 100-fold higher than the highest desired concentration in DMSO, then dilute the inhibitor 20-fold in Assay Buffer to prepare the highest concentration of the 5-fold intermediate dilutions. The concentration of DMSO is now 5%.

Prepare serial dilutions of the Test Inhibitor at 5-fold the desired final concentrations using 5% DMSO in Assay Buffer to keep the concentration of DMSO constant.

For positive and negative controls, prepare 5% DMSO in water (vol/vol) so that all wells contain the same amount of DMSO (Diluent Solution).

The final concentration of DMSO should not exceed 1%.

5) To the wells designated as "Blank", add 4 μ l of **5x TRF Ubiquitin Mix** + 1 μ l of **UBE1** + 1 μ l of **UBCH5b** + 4 μ l of **diluent solution** (for example DMSO 5%) + 5 μ l of **assay buffer** + 5 μ l of **ATP (4 mM).**

	Blank
TRF Ubiquitin Mix (5x)	4 μΙ
UBE1	1 μΙ
UBCH5b	1 μΙ
C-CBL/TYRO3	-
Test Compound	-
Diluent solution* (no inhibitor)	4 μΙ
assay buffer	5 μΙ
ATP (4 mM)	5 μΙ
Total	20 μΙ

^{*}The diluent solution contains the assay buffer with the same concentration of solvent (e.g. DMSO) as the test compound solution.

6) Make the Master Mix using **diluted** reagents as prepared in steps 2 and 3:

N wells \times (4 μ l 5x TRF Ubiquitin Mix + 1 μ l UBE1 + 1 μ l UBCH5b + 2.5 μ l C-CBL + 2.5 μ l TYRO3).

- 7) Add 11 μ l of master mixture to each well designated for the "Negative Control", "Positive Control", "Test Sample".
- 8) Add 4 μ l of inhibitor solution to each well designated "Test Inhibitor". For "Positive Control" and "Negative Control", add 4 μ l of the diluent solution without inhibitor.
- 9) Initiate the reaction by adding 5 μ l of **ATP** to the wells labeled "Positive Control" and "Test Inhibitor." Add 5 μ l of **assay buffer** to the well designated "Negative Control." Cover the plate with a plate sealer. Incubate the reaction at 30°C for 40 minutes or at room temperature for one hour.

	Test Inhibitor	Negative Control	Positive Control
Master Mix	11 µl	11 μl	11 μl
Test compound	4 μΙ	_	-
Diluent solution* (no inhibitor)	_	4 μΙ	4 μΙ
assay buffer	-	5 μΙ	_
ATP (4 mM)	5 μΙ	_	5 μΙ
Total	20 μΙ	20 μΙ	20 μΙ

^{*}The diluent solution contains the assay buffer with the same concentration of solvent (e.g. DMSO) as the test compound solution.

10) Read the fluorescence intensity in a microtiter-plate reader capable of measuring TR-FRET. "Blank" value is subtracted from all other values.

Instrument Settings

Reading Mode	Time Resolved	
Excitation Wavelength	340±20 nm	
Emission Wavelength	620±10 nm	
Lag Time	60 μs	
Integration Time	500 μs	
Excitation Wavelength	340±20 nm	
Emission Wavelength	665±10 nm	
Lag Time	60 μs	
Integration Time	500 μs	

CALCULATING RESULTS:

Two sequential measurements should be conducted. Tb-donor emission should be measured at 620 nm followed by dye-acceptor emission at 665 nm. Data analysis is performed using the TR-FRET ratio (665 nm emission/620 nm emission).

When percentage activity is calculated, the FRET value from the Blank (it is expected that Blank and Negative Control represent similar value) can be set as zero percent activity and the FRET value from the positive control can be set as one hundred percent activity.

$$\% \text{ Activity} = \frac{\text{FRET}_{\text{s}} - \text{FRET}_{\text{blank}}}{\text{FRET}_{\text{p}} - \text{FRET}_{\text{blank}}} \times 100\%$$

Where FRETs = Sample FRET, FRET_{blank} = Blank FRET, and FRET_P = Positive control FRET.

Example Results

Figure 1: Inhibition of C-CBL-driven Tyro3 ubiquitination. C-CBL-dependent ubiquitination of Tyro3 was measured in the presence of increasing concentrations of CBL-IN-1 inhibitor (MedChem Express, #HY-136339) using the C-CBL-driven Tyro3 Ubiquitination Intrachain TR-FRET Assay Kit (BPS Bioscience #78408).
